Q3. Call the `summary()` function on your results to get a sense of how many genes are up or down-regulated at the default 0.1 p-value cutoff.

```
summary(res)
```

```
##
## out of 15975 with nonzero total read count

Volcano Plot

```
plot( res$log2FoldChange, -log(res$padj) )
```

Q4. Improve this plot by completing the below code, which adds color and axis labels

```
# Make a color vector for all genes
mycols <- rep("gray", nrow(res) )

# Color red the genes with absolute fold change above 2
mycols[ abs(res$log2FoldChange) > 2 ] <- "red"
```

```

# Color blue those with adjusted p-value less than 0.01
# and absolute fold change more than 2
inds <- (res$padj < 0.01) & (abs(res$log2FoldChange) > 2 )
mycols[ inds ] <- "blue"

plot( res$log2FoldChange, -log(res$padj), col=mycols, xlab="Log2(FoldChange)", ylab="-Log(P-value)" )

```

Adding gene annotation

Q5. Use the `mapIDs()` function multiple times to add SYMBOL, ENTREZID and GENENAME annotation to our results by completing the code below.

```

```
## Warning: package 'AnnotationDbi' was built under R version 4.1.2

Q8: What pathway has the most significant “Entities p-value”? Do the most significant pathways listed match your previous KEGG results? What factors could cause differences between the two methods?

Endosomal/Vacuolar Pathway has the most significant “Entities p-value”. The significant pathways listed do not match my previous KEGG results. The differences could be caused by how KEGG uses gene annotations from ENTREZ IDs, and Reactome Analysis looks for significant genes based on p-value.

Section 5 GO online (Optional)

Q9: What pathway has the most significant “Entities p-value”? Do the most significant pathways listed match your previous KEGG results? What factors could cause differences between the two

methods?

platelet-derived growth factor receptor signaling pathway. Not similar to KEGG results. Not sure what could cause the difference.
